

Exercise Simulation – 26 February, 1700HRS Storm Update

St. George's, Grenada – 26 February

As of 5:00 PM, monitoring of the simulated storm system remains ongoing.

Additional analysis of the five (5) meteorological images received earlier today confirms continued cloud development and unstable weather conditions across parts of the island. Two (2) voice notes from field teams have provided situational feedback indicating intermittent heavy rainfall, moderate wind gusts, and minor flooding in low-lying areas within the exercise scenario.

Response teams have reviewed the short field report and are assessing potential impacts under the simulation framework. Coordination remains active between meteorological officials, district teams, and emergency management personnel to ensure accurate information flow and readiness for any escalation.

There are no reports of injuries or significant infrastructure damage within the parameters of this exercise.

The public is reminded that this is part of a scheduled simulation exercise aimed at strengthening national preparedness, communication systems, and inter-agency coordination.

Further updates will be issued as the exercise progresses.
